

ZEPTO CAFE

Step 6: Metrics & Success Measurement

How we know the habit loop is working — and how we protect what we already have

Product	PM	Date
Zepto Cafe	Rishi Raj Sahu	July 2026

1. North Star Metric

The **North Star Metric (NSM)** is the single number that best captures whether the Zepto Cafe habit loop is working. It must be directly tied to repeat behaviour (not acquisition), measurable weekly, and actionable by the product team.

North Star Metric: 30-Day Repeat Order Rate

Definition: % of users who place at least 2 Zepto Cafe orders within any 30-day window

Baseline (Current)	Target (6 Months)
12%	25%
~12,000 repeat orders / day at 100K daily volume	~25,000 repeat orders / day — +108% improvement

1.1 Why This Metric

- Directly measures habit formation — the core product bet. A user who repeats within 30 days has formed a salient memory of the experience.
- Not inflated by acquisition spends or promotions — a discount-driven surge in first orders will NOT move this number.
- Predictive of LTV: industry data shows users who reach 3 orders in 30 days generate 4.5x monthly GMV vs. single-order users.
- Owned by the product team: it is not impacted by kitchen capacity, delivery SLA, or ad spend — making it a clean signal.

1.2 NSM Decomposition

The NSM decomposes into a three-stage funnel. Each stage has its own leading indicator that the team can act on immediately:

Funnel Stage	Leading Indicator	Why It Matters
CUE lands	Reorder card CTR / Push open rate	If users are not seeing or tapping the trigger, the entire loop fails before it starts.
ROUTINE executed	Push-to-order conversion rate	CUE fired, but did the user complete the order? Low conversion = friction in the cart/checkout step.
REWARD reinforces	D3 and D7 return rate	Did the user come back by Day 3 and Day 7? These are the earliest signals of habit formation before the full 30-day window closes.

2. Supporting Metrics

Supporting metrics validate that each product feature is contributing to the NSM. They are grouped by sprint to reflect when each feature ships and when each metric becomes measurable.

2.1 Sprint 1 Metrics — Core Habit Loop (Month 1–2)

Metric	Baseline	Target	What It Tells Us
Reorder card CTR (S5)	—	≥25%	The "Your Usual" card is visible and compelling. Below 15% = copy/placement problem.
D3 return rate	~5%	≥35%	Users came back within 3 days — earliest signal of habit intent.
D7 return rate	~8%	≥30%	Week-over-week habit signal. Most habit researchers use D7 as the first reliable predictor.
In-app banner CTR (S4)	—	≥18%	Time-of-day contextual banner at 3:30 PM. CTR below 10% = wrong time window or poor copy.
Push notification open rate (S1)	—	≥20%	Industry benchmark for personalised push is 7-12%. Target 20% reflects personalisation advantage.
Push-to-order conversion	—	≥40%	Of users who open the push, 40% should complete an order. One-tap reorder makes this realistic.
Push opt-out rate (S1)	—	<1%	If users are opting out, the push is too frequent or poorly personalised. Treat as a red-alert metric.
Post-order 3-emoji rating completion (S9)	—	≥55%	Drives personalisation quality. Low rate = friction in rating UX. Critical for S1 push accuracy.

2.2 Sprint 2 Metrics — Reward Loop (Month 2–3)

Metric	Baseline	Target	What It Tells Us
Stamp card widget engagement (S3)	—	≥60%	60% of repeat users interact with stamp card (tap, view progress). Below 40% = widget is invisible.
Stamp 5 mid-progress open rate (S3)	—	≥45%	At the halfway point (stamp 5), users should re-engage due to loss aversion.

Metric	Baseline	Target	What It Tells Us
Stamp-to-redemption rate (S3)	—	≥70%	Of users who reach stamp 9, 70% should complete stamp 10 for the free item. Drop-off = cart friction.
First Reorder Accelerator conversion (S15)	—	≥30%	Bonus stamps for Order 2 within 3 days. Target 30% of eligible users to take the accelerated path.
Saved favourites usage (S6)	—	≥40%	40% of repeat users use saved favourites as their reorder path (vs. the reorder card or push).

2.3 Sprint 3 Metrics — Depth (Month 4–5)

Metric	Baseline	Target	What It Tells Us
Chai Streak D7 retention (S2)	—	≥35%	Of users who start a streak, 35% maintain it through Day 7 — habit anchoring working.
Social proof CTR (S10)	—	≥12%	"Your colleague ordered this" nudge drives 12%+ incremental CTR for Persona 3.
Freshness badge order uplift (S8)	—	+8% for tagged items	Items with freshness/quality badge show 8%+ higher reorder rate vs. untagged items of same category.
30-day order frequency (all habits active)	1.2 orders/user	≥3.5 orders/user	The compounding indicator — by Month 5 with all features active, habituated users should average 3.5 orders/month.

3. Revenue Model — Business Impact

3.1 The Repeat Rate → GMV Bridge

Every 1 percentage point improvement in the 30-day repeat rate adds approximately ₹1,000 repeat orders per day at the current 100K daily order baseline. At ₹100 AOV, that is ₹1 lakh incremental GMV per day per percentage point.

Repeat Rate Milestone	Repeat Orders/Day	Incremental vs. Baseline	Incr. GMV/Day	Incr. GMV/Year
12% (Baseline)	12,000	0	₹0	₹0
15% (Month 1-2)	15,000	+3,000	+₹30L	+₹110 Cr
18% (Month 3)	18,000	+6,000	+₹60L	+₹219 Cr
21% (Month 4-5)	21,000	+9,000	+₹90L	+₹329 Cr
25% (Month 6 Target)	25,000	+13,000	+₹1.3 Cr	+₹47 Cr

The ₹47 crore figure assumes flat AOV (₹100) and no frequency acceleration beyond Order 2. It is a conservative floor. Habituated users (3+ orders/month) generate ~₹350/month vs. ₹100 for single-order users — the real LTV upside is 3.5x the floor estimate.

3.2 Cohort Revenue Ramp Model

Month	Repeat Rate	Repeat Orders/Day	GMV/Day (Total)	Key Driver
0 (Launch)	12%	12,000	₹12L	Baseline — no features yet
1	14%	14,000	₹14L	S5 reorder card + S4 banner live
2	16%	16,000	₹16L	S1 Chai O'Clock push + S9 rating live
3	18%	18,000	₹18L	S3 stamp card + S15 first reorder accelerator
4	20%	20,000	₹20L	Sprint 2 fully active — reward loop embedded
5	22%	22,000	₹22L	Sprint 3 depth features (streak, social proof)
6	25%	25,000	₹25L	Full habit loop — all Sprint 1-3 features active

4. Guardrail Metrics

Guardrail metrics are the "do no harm" constraints. They ensure the habit-loop features do not create negative side effects that erode the core Zepto experience or damage user trust. Any guardrail breach triggers an immediate feature pause for investigation.

Guardrail Metric	Threshold	Alert Level	Why It Matters
Overall Zepto app uninstall rate	No increase > +0.5% vs. baseline	Red — immediate push pause	Push frequency is the most common driver of uninstalls. Any spike must be traced to the Chai O'Clock feature.
Reorder cart abandonment rate	Below 25%	Yellow at 20%, Red at 25%	One-tap reorder adds a pre-filled cart. If users abandon the pre-filled cart more than a manually built cart, the reorder UX has friction.
Cafe home screen load time	No increase > +200ms P95	Yellow at +100ms, Red at +200ms	Reorder card requires an API call to fetch order history. Must not degrade the home screen experience for non-repeat users.
First-order completion rate	No drop > -2% vs. baseline	Yellow at -1%, Red at -2%	Habit-loop features must not distract new users from completing their first order. Stamp cards and reorder cards should not be surfaced before Order 1 is complete.
Push notification opt-out rate	<1% of push-eligible users/ week	Yellow at 0.5%, Red at 1%	Opt-out is a leading indicator of push fatigue. Once a user opts out, the entire CUE layer is lost permanently for them.
Negative sentiment in post-order rating	No increase in 1-star ratings > +1pp	Yellow at +0.5pp, Red at +1pp	If the reorder experience surfaces stale or wrong "Your Usual" data, it degrades product perception. Rating data is the canary.

4.1 Guardrail Escalation Protocol

- Yellow threshold: Engineering team notified. Root cause investigation begins within 24 hours. Feature continues running.
- Red threshold: Feature is paused within 2 hours. Incident review opened. PM and Eng lead notified. Feature only re-enables after root cause is identified and fixed.
- Any two Yellow thresholds simultaneously = treat as Red.

5. Event Tracking Specification

This section defines the product analytics events required to measure every metric defined above. Events follow the format: `object_action` (noun_verb). All events fire client-side and are validated server-side before being written to the data warehouse.

5.1 Naming Conventions & Global Properties

Event format: `<object>_<action>` | Example: `reorder_card_tapped` | All events inherit global properties automatically.

Global Properties (Auto-Attached to Every Event)

Property	Type	Description
user_id	string	Hashed Zepto user identifier
session_id	string	App session UUID
timestamp	ISO 8601	Event fire time in UTC
platform	enum: ios android	Client platform
app_version	string	Zepto app version string
city	string	User's delivery city
is_pass_user	boolean	Whether user has active Zepto Pass
cafe_order_count	integer	Total Zepto Cafe orders placed by this user (lifetime)

5.2 Reorder Card Events (S5)

Event Name	Properties
reorder_card_shown	item_name, item_id, last_order_date, card_position (integer — position on home screen)
reorder_card_tapped	item_name, item_id, card_position, time_since_last_order_days
reorder_card_dismissed	item_name, item_id, card_position, reason (swipe x_tap)
reorder_cart_loaded	item_name, item_id, prefilled (boolean), cart_value
reorder_order_placed	item_name, item_id, order_value, is_reorder (true), time_to_order_seconds
reorder_cart_abandoned	item_name, item_id, cart_value, step_abandoned (cart_view address payment)

5.3 Chai O'Clock Push Events (S1)

Event Name	Properties
push_scheduled	push_id, scheduled_time, day_of_week, item_name, scenario (A B C)
push_sent	push_id, send_time, item_name, push_copy_variant
push_delivered	push_id, delivery_time, delivery_status
push_opened	push_id, open_time, seconds_since_send, lock_screen (boolean)
push_dismissed	push_id, dismiss_time, dismiss_source (lock_screen notification_tray)
push_opted_out	push_id, opt_out_source (long_press settings), days_since_first_push
push_suppressed	push_id, suppression_reason (freq_cap weekend opted_out item_unavailable)
push_deep_link_loaded	push_id, reorder_card_shown (boolean), load_time_ms

5.4 In-App Banner Events (S4)

Event Name	Properties
banner_shown	banner_type (chai_oclock), show_time, item_name, user_time_of_day
banner_tapped	banner_type, tap_time, item_name
banner_dismissed	banner_type, dismiss_time, dismiss_method (swipe x)

5.5 Stamp Card Events (S3)

Event Name	Properties
stamp_card_viewed	stamps_earned (integer 0-10), stamps_remaining
stamp_earned	stamp_number, order_id, was_accelerator_stamp (boolean)
stamp_milestone_nudge_shown	milestone (5 9), stamps_earned
stamp_card_completed	total_orders_to_complete, days_to_complete, accelerator_used (boolean)
stamp_reward_redeemed	reward_item, order_id, days_since_card_completed

5.6 Post-Order Rating Events (S9)

Event Name	Properties
rating_prompt_shown	order_id, item_name, delay_seconds_after_delivery
rating_submitted	order_id, item_name, rating (1-3 emoji), feedback_tag (optional)
rating_skipped	order_id, item_name

5.7 Retention / Conversion Events (North Star Support)

Event Name	Properties
cafe_session_started	entry_source (push banner organic reorder_card deep_link)
cafe_order_placed	order_id, order_value, item_count, is_repeat_user (boolean), order_sequence_number, entry_source
d3_return_detected	user_id, days_since_order_1, entry_source (computed server-side)
d7_return_detected	user_id, days_since_order_1, entry_source
30d_repeat_achieved	user_id, orders_in_window, first_order_date, last_order_date

6. Measurement Cadence & Review Rhythm

Cadence	Who Reviews	What's Reviewed
Daily	PM + Data Analyst	Reorder card CTR, push opt-out rate, uninstall delta, guardrail alerts
Weekly	PM + Eng Lead	D7 return rate, push open + conversion, banner CTR, stamp engagement, cohort funnel
Bi-weekly	PM + Design + Eng	Full funnel review, A/B test read-outs, feature flag decisions, sprint gate checks
Monthly	PM + Leadership	30-day repeat rate vs. target, GMV impact model update, guardrail status, roadmap reprioritization
End of Sprint 1 (Month 2)	Full team	Sprint gate: CTR $\geq 25\%$, D7 return $\geq 30\%$. Decision to proceed to Sprint 2 or hold.
Month 6	Leadership + PM	NSM target check: 30-day repeat rate $\geq 25\%$. Full GMV impact vs. model. Phase 2 decision.

The metrics framework is built to give the team signal within 2 weeks of launch (D7 return rate), not just after the full 6-month window closes. Every sprint gate is defined before the sprint begins, so there is no post-hoc rationalization of results.
